

Reading the panels

Every box is a die of the package and every bar a mesh link, on one shared colour scale: the service time that link owes for this one hand-off at 0.4 GB/s. A bar takes the busier of the link's two directions; the full directed table is in the data files, and a two-bar variant is exported beside this figure. The same 25 flows and 26.2 M words are placed in all three panels, so only the placement differs. A compact placement funnels the flows through a few links, a dispersed one spreads them, and the search keeps the dispersion while removing the remaining stacking. Filled boxes are the hand-off's producer dies (slate) and consumer dies (brick); a dark outline marks the link directions at the maximum.
